NATURAL RESOURCES CONSERVATION SERVICE CONSERVATION PRACTICE STANDARD

ALLEY CROPPING

(Acre)

DEFINITION

Trees or shrubs planted in a set or series of single or multiple rows with agronomic, horticultural crops or forages cultivated in the alleys between the rows of woody plants.

PURPOSE

- Produce tree and/or shrub products (wood, nuts, berries, fodder, mulch, etc.) along with crops or forages.
- Improve crop or forage quality and quantity by enhancing microclimatic conditions.
- Reduce surface water runoff and erosion.
- Improve utilization and recycling of soil nutrients.
- Reduce subsurface water quantity or alter water table depths.
- Provide or enhance wildlife habitat.
- Create habitat for biological pest management.
- Improve crop diversity, quantity, quality and economic returns.
- Decrease movement offsite of nutrients or chemicals.
- Enhance the aesthetics of the area.
- Increase carbon storage in plant biomass and soils.
- Improve air quality.

CONDITIONS WHERE PRACTICE APPLIES

On all lands where trees, shrubs, crops and/or forages can be grown in combination.

CRITERIA

General Criteria Applicable to All Purposes

Comply with applicable federal, state and local laws and regulations, during the installation, operation (including product harvesting), and maintenance of this practice.

The trees or shrubs will be protected from fire and livestock damage.

The location, layout, species and density of the trees and shrubs will accomplish the purpose and intended function for both the agronomic, horticultural, or forage crop as well as the trees or shrubs.

Plant species selection will be based on the following:

- Combinations of alley crops and woody plants shall be compatible and complementary, and provide the products and crops that meet landowner objectives and financial goals.
- Alley crops shall be adapted to the climatic region and the soil resource, marketable and suited to the landowner's equipment and management capabilities.
- Alley crop sequence and woody species selection shall be determined using an acceptable nutrient balance procedure.
 Select crops, forages and woody species to maximize the utilization and recycling of soil nutrients, livestock manure's and plant residues and to maintain soil organic matter content.
- Alley crops and woody plants shall be selected for compatible rooting depths and water requirements not to exceed available soil water.

Conservation practice standards are reviewed periodically. To obtain a current version of this standard contact the Natural Resources Conservation Service.

NRCS MOFOTG July 2004

- Select pest resistant plant varieties.
- Avoid selecting tree or shrub species that provide habitat to animal, bird, and insect species or diseases considered being pests of the accompanying crop or forage.
- For optimal carbon storage, select plant species that are adapted to the site to assure strong health and vigor.
 Plant/manage the appropriate density for the site that will maximize above and below ground biomass production.

System design. The distance between the sets of trees or shrubs will be adequate for the inter-crops in the alleys and be determined by the following management objectives:

- Light requirements and growth period of the crops or forages in the alleys.
- Erosion control needs.
- Machinery widths and turning areas.

Soil erosion will be controlled by vegetative or other means until the alley cropping design is fully functional.

Follow acceptable planting dates and use care in handling and planting the seed or seedlings.

Avoid planting trees or shrubs where they will interfere with structures and above or below ground utilities.

Only viable and high quality planting stock or seed of adapted woody species will be used for establishing the tree or shrub rows.

Site preparation shall be sufficient for establishment and growth of selected species and appropriate for the site.

Additional Criteria to Reduce Excess Surface Water Runoff and Erosion

A herbaceous strip (follow CONTOUR BUFFER STRIPS - 332) will be developed immediately upslope and parallel to each woody planting row set.

Use multi-row woody planting sets.

Tree or shrub rows will be oriented on or near the contour to control water erosion or perpendicular to the prevailing wind erosion direction to control wind erosion or wind damage.

NRCS MOFOTG July 2004

Selected species of trees and shrubs will be relatively deep rooted to encourage infiltration.

Additional Criteria to Reduce Excess Subsurface Water or Control Water Table Depths

Choose woody species that are deep rooting and have rapid growth rates such as hybrid poplar, cottonwood, black willow, green ash, and silver maple.

Use multi-row woody planting sets.

Additional Criteria to Provide Food and Cover for Wildlife Habitat

Maximize plant diversity. Use multi-row woody planting sets with plants of different sizes, growth forms, and densities.

Maximize wildlife food availability. Leave edge rows between the woody planting and intercrop for wildlife food. Use plants with foodbearing capabilities.

Use native wildlife friendly plant species wherever possible.

Additional Criteria to Improve Air Quality

Use plant species in the alley that provide full ground coverage during establishment and harvest operations.

Residue from the alley-crop shall be left on the surface. Select and maintain tree/shrub species with foliar and structural characteristics that optimize interception, adsorption and absorption of air-borne particulates.

Tree or shrub rows will be oriented as close to perpendicular as possible to prevailing wind direction during the critical air period.

CONSIDERATIONS

Select alley crops and tree/shrub varieties that are tolerant to herbicides that will be used in the management of the crops, forages, trees or shrubs.

Spacing between the rows of trees or shrubs may be adjusted, within the limits listed above, to accommodate equipment widths, turnrounds and maintenance needs of the woody planting.

Species diversity including use of native species should be considered to avoid loss of function due to species-specific pests.

High value trees or shrubs and alley crops should be selected to maximize economic returns.

Establish plant species that enhance the biomass collection opportunities.

Increasing the number of rows in the tree/shrub set will increase the potential for carbon sequestration.

PLANS AND SPECIFICATIONS

Specifications for applying this practice shall be prepared for each site and recorded using approved specification sheets, job sheets, and narrative statements in the conservation plan, or other acceptable documentation.

OPERATION AND MAINTENANCE

The trees, shrubs, and crops will be inspected periodically and protected from adverse impacts including insects, diseases, damaging wildlife activity, livestock activity, fire or competing vegetation.

All other specified maintenance measures and techniques of tree/shrub establishment will be continued until plant survival and establishment are assured. (90 % of all trees and shrubs planted with no two adjacent within row plants missing.) This includes replacement of damaged, dead and dying trees or shrubs and control of undesirable competing vegetation.

Any removals of tree or shrub products and use of fertilizers, pesticides, and other chemicals shall be conducted in a manner that maintains the intended purpose.

The type, use and timing of maintenance equipment will be appropriate to accomplish operation and maintenance tasks while not damaging or degrading the site, existing crop species, and soil conditions.

After the fifth year following establishment, woody lateral roots may need to be pruned. See TREE/SHRUB PRUNING (660).

PRACTICE SPECIFICATIONS

Site Preparation

Use FOREST SITE PREPARATION (490), General Specifications for guidance.

Planting Methods

Use TREE/SHRUB ESTABLISHMENT (612). Control competing vegetation for a minimum of 3-4 feet on either side of the woody row.

Woody Species Selection

Base plant selection on soil types, site characteristics, site limitations, landowner objectives, projected canopy characteristics, and sunlight and moisture requirements for the inter-crop. Tables 1a, 1b, and 1c list selected woody species that may have potential as an alley cropping system choice. Other species may be used providing they meet the selection criteria list above.

See WILDLIFE UPLAND HABITAT MANAGEMENT (645) for additional woody species recommendations.

Spacing/Layout

See TREE/SHRUB ESTABLISHMENT (612) for within row spacing guidance. When multiple row woody planting sets are used, stagger row plantings.

Use Table 2 as a guide for woody planting rates when row sets and alley widths of 15 to 40 feet are used.

Use the CONTOUR BUFFER STRIPS (332) standard as a guide for determining the spacing distance between woody plant rows when erosion control is a concern.

When erosion control is not a concern, spacing distance between woody plant rows should be based on landowner management objectives, tree and shrub environmental requirements, light requirements and growth periods of the crops in the alleys, and machinery width needs.

Table 1a. Examples of potential hardwood tree species for use in alley cropping

Common Name	Upland	Bottom Land	Wood Product s	Biomass/ fuelwood	Food Products ¹	Wildlife Food	Leaf ² Initiation	Leaf Drop ³	Canopy Shade	Comments	
Basswood	Х		Х				early	mid	full	Wood used for carving	
Black locust	Х			Х			mid	mid	light	Excellent fuelwood	
Black walnut	Х	Х	Х		Х	Х	late	early	light	Deep well-drained sites	
Bur oak	Х	Х	Х			Х	late	late	full	Drought and flood tolerant	
Chestnut	Х		Х		Х	Х	mid	mid	medium	Use disease resistant varieties	
Ginko	Х				Х		late	mid	light	Herbal/medicinal uses	
Green ash	Х	Х	Х				mid	mid	medium	Adapted to a wide range of sites	
Honey locust	Х	Х		Х		Х	mid	early	light	Use thornless variety	
Hybrid poplar	Х	Х	Х	Х			mid	early	light	Rapid growth; deep rooting	
N. red oak	Х		Х			Х	late	late	full	Widely used for wood products	
Paulownia	Х	Х	Х	Х			early	early	medium	Wood prized in the orient	
Pecan		Х	Х		Х	Х	mid	mid	medium	Use native stock for grafting	
Sugar maple	Х		Х		Х		early	mid	full	Maple syrup and quality wood	
Sycamore		Х	Х	Х			late	mid	medium	Tolerates wet sites	
White oak	Х		Х			Х	late	late	full	Fine hardwood; deep rooting	
Yellow poplar	Х	Х	Х				mid	mid	medium	Fast growing	

- 1 Includes fruits, nuts, jellies, jams, wine, syrup, honey, herbals, etc.
- 2 Start of leaf growth. **Early**: by mid-April; **Mid**: mid-April to May 1; **Late**: after May 1.
- 3 Begin of leaf drop. **Early**: before mid-October; **Mid**: mid-October to Nov 1; **Late**: after November 1.

Table 1b. Examples of potential shrub/small tree species for use in alley cropping

Common Name	Upland	Bottom Land	Human Product s	Wildlife Food	Showy Flowers	Plant size (feet)	Comments
American plum	X	Х	Х	Х	Х	15 to 20'	Jellies, preserves, and wine
Apple/pear/cherry	Х		Х		Х	Variable	Use commercial varieties
Blackberry/ Raspberry	Х		Х	Х		6 to 8'	Use commercial varieties
Blueberry	Х		Х	Х	Х	6 to 8'	Use commercial varieties
Crabapple	Х	Х		Х	Х	20 to 25'	Jellies, preserves
Hazelnut	Х		Х	Х		3 to 10'	Sweet nuts
Pawpaw	Х	Х	Х	Х		Up to 30'	Large, edible, nutritional fruit
Serviceberry	Х			Х	Х	20 to 30'	Excellent for wildlife
St. John's Wort	Х		Х		Х	Up to 6'	Herbal remedies; nectar source
Witch hazel		X	Х			Up to 30'	Numerous medicinal uses

Table 1c. Examples of potential conifer species for use in alley cropping

Common Name	Wood Product s	Christmas Trees	Wildlife Food & Habitat	Nursery Material	Windbreak Value	Comments
Concolor fir		Х		Х	Х	Beautiful foliage color
E. redcedar	Х	Х	Х		Х	Adaptable to a wide range of sites Alternate host for cedar-apple rust
Loblolly pine	Х					Tolerates wet sites

Shortleaf pine	Х		Х			Only native pine. Tolerates dry sites
White pine	X	X		X	X	Needs well-drained sites.
